Project Background

The discourse around sexual assault, sexuality, and sex positivity is often centered around consent and male entitlement. A prevalent belief (and legal defense) in this gendered society is the prevalent notion that the choice of clothing often contributes to instances of sexual assault and rape. More specifically, attire has been frequently cited in legal cases as a form of “implied consent”

As part of our project, we aim to collect and analyze data, both quantitative and qualitative, to determine the validity and indeed the accuracy of this notion. We hope to show that this rhetoric between what one wears and consent is grossly misunderstood and that, moreover, it is compounded upon by institutional structures such as dress codes and legal privileges. Through a series of interactive visualizations, we intend to illustrate the relationship between self-image and external appraisal of one’s clothing, and the way in which these perceptions are codified.

Our research methods will include a mixed methodology of literature review of published papers and articles, police reports, the study of legal cases, along with stakeholder interviews. We will additionally conduct a large-scale study using Amazon Mechanical Turk to gauge perceptions of clothing articles by gender, assess underlying biases, and create a central dataset that can attempt to simultaneously address the various lenses with which prior studies have approached this topic. We will finally visualize the relationship of our study to prior work in the field in order to suggest a causal link.

Within Clothing

The scale and pattern

2021 Over the past year in India, **rape in India rose by almost 20% - averaging around 87 cases per day**. Scores of additional cases go unreported each day. Gendered violence In the same timeframe, crimes against women rose by 63%. These numbers reflect a rising trend of gendered violence throughout the country. Finally, the poor conviction rates, victim-shaming practices, , and persisting misogyny point to a legal system that enables gender-based violence, and on occasion, even endorses it.

Gap and Opportunity area

One important facet of this discourse is clothing, which is a manifestation of choice, identity, and freedom.

Clothing as a defense - Little work, if any has investigated how clothing affects legal outcomes Research has established the ways in which we hold differing conceptions of ourselves and of others depending on one's dress.

The opportunity

While personal narratives have been ubiquitous in this discourse, there have been few narratives that have combined the larger data to the personal narratives to drive home the need for serious interventions.

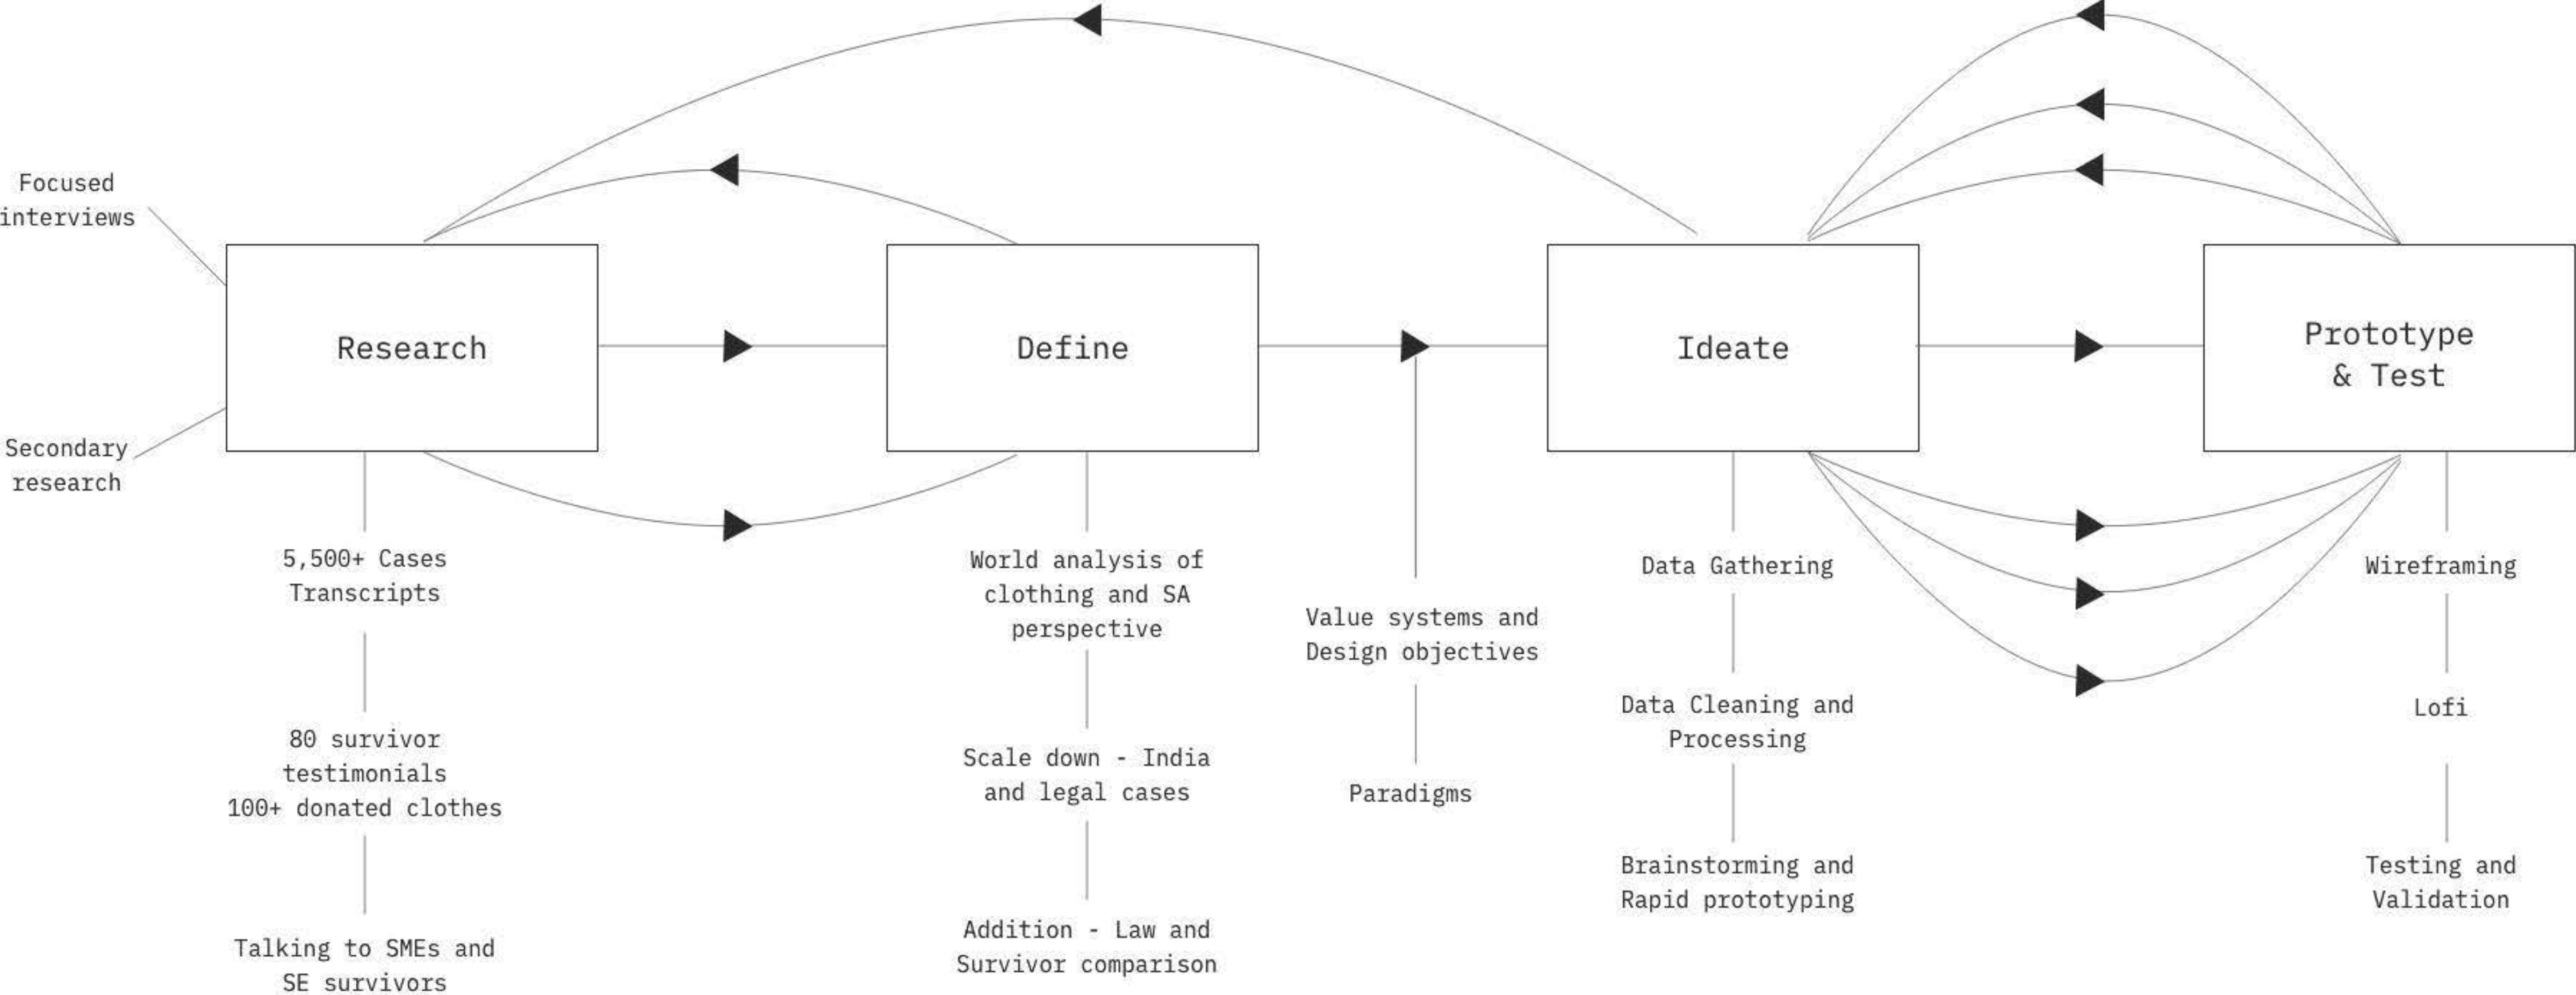

Value Systems

- 01 Sensitivity is key
In dealing with and representing information, especially personal narratives.
- 02 Strive for multiplicity
To capture as diverse and nuanced experiences as possible, within different contexts and at varying scales.

Design objectives

- 01 Reflect the **scale** at which sexual assault is validated with victim-blaming (especially clothing and sexuality), across institutions.
- 02 Showcase **distinct perceptions**, while also highlighting differences between perceptions and lived experiences.
- 03 Identify **language and verbiage** that emerge when sexual violence is systemically enabled.

Design Process

Technical overview

When we began our research, we started by looking at the existing work which addressed the way in which attire directly relates to sexual assault. Researchers had thoroughly examined the relationship between both the conception we have of another when they wear different clothing, as well as the effect on self-image that dress has. Yet little research had been conducted on the way in which the victim's dress is systemically institutionalized either through dress codes or clothing bans, or in court cases where the question 'what was she wearing' is subversively used to introduce doubt or cast blame on the victims. We initially intended to examine the United States, where we found by far the largest volume of case transcripts and case data, but although the US government's Public Access To Court Electronic Records (PACER) seemed to be a promising start, searching for a name or term costs "\$30.00 per name or item searched plus \$0.10 per page per document delivered electronically", making even small-scale analysis of thousands of cases relatively unaffordable to the public who it claims to provide access to. As a result, we turned to India, where a far larger population provided ample cases to analyze for relatively little cost through a series of automated pipelines.

Our technical workflow is discussed in further detail, but at the largest level, our data came as a list of unstructured text bodies from IndiaKanoon, our processing, documentation, and workflow is hosted on GitHub (https://github.com/JuliusStein/kanoon_transcript_nlp), and our main dependency for analysis was GPT-3.

Ideation

Making: Key Tools

Technical overview

Data Collection: Indian Kanoon

- 01 Metadata providing the date, judge, and courthouse of each transcript. Analyzed all transcripts returned for the query "sexual assault" which returned roughly 5500 cases.

Processing Pipeline: OpenAI

- 01 GPT-3 to read and analyze the outcome of each case & label our cases according to the presence of clothing in the transcript.

Data creation

Transcript Analysis: NLTK

- 01 Analyzed their contents through a variety of natural language processing approaches to search for patterns in the language used in cases where clothing was mentioned.

Data for further analysis

- 01 Examined statistical correlation between mentions of clothing and acquittals, regional differences in case outcomes, acquittal frequency over time, etc.

Making: Key Methods (Data Gathering & Cleaning)

Much of our early work involved querying Kanoon and gathering the case data. Because our free license would only allow us to query a few hundred full texts in addition to returning the id's returned from an initial query, we set up a pipeline to make new accounts for Kanoon which would query a different subset of the pages of cases, storing each as in a Pandas dataframe and uploading them all joined as one JSON list using GitHub LFS. We then created an automated pipeline to label each case for the key missing parameter - the case outcome - as well as the presence of language around dress or clothing. After all 5500 cases were queried, processed, and labeled, we explored the trends that we could find from disaggregating the data by the date, the presence of clothing, the region or court, and the particular judge who tried each case. The analysis revealed a number of concerning discrepancies in conviction rates across each of the desegregations, though ultimately our initial hypothesis that cases which discussed the victims' attire would be less likely to lead to an acquittal were disproven.

Making: Key Methods (Data Processing)

All of our data processing was done in python. Beginning with the dataframe shown previously, we analyzed the textual trends using a bag of words model from genism's implementation of Word2Vec, in which each token within the corpus is turned into a vector that can be compared to other vectors through cosine-similarity. Separately, we plotted the line-trends using matplotlib by simply positioning each case temporally and using the labels generated by GPT-3 to color and filter them. Audio was analyzed similarly, though we first needed to use googles text to speech to cut fragments of the audio, translate each to a string, and then join all strings after the full audio had been parsed.

```
import gensim
from gensim.models import Word2Vec

f = alltexts.replace("\n", " ")
data = []
print("Tokenizing Sentences...")
sentence_tokens = sent_tokenize(f)
# iterate through each sentence in the file
for i, tok in enumerate(sentence_tokens):
    temp = []
    if(i%10000 == 0):
        print(i,"of",len(sentence_tokens), 'tokens complete')
    # tokenize the sentence into words
    for j in word_tokenize(tok):
        temp.append(j.lower())
    data.append(temp)

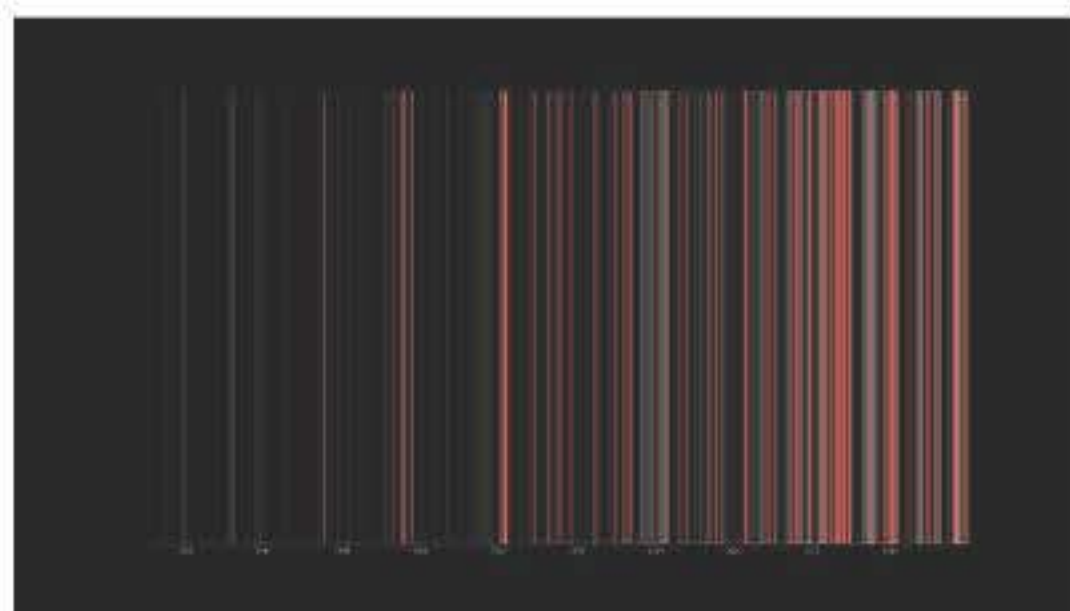

# Create Common Bag Of Words model
print("All tokens generated! Building Bag of Words model...")
model1 = gensim.models.Word2Vec(data, min_count = 1,
                                vector_size = 100, window = 5)
```

```
for i, audio_chunk in enumerate(chunks, start=1):
    # export audio chunk and save it in
    # the `folder_name` directory.
    chunk_filename = os.path.join(folder_name, f"chunk{i}.wav")
    audio_chunk.export(chunk_filename, format="wav")
    # recognize the chunk
    with sr.AudioFile(chunk_filename) as source:
        audio_listened = r.record(source)
        # try converting it to text
        try:
            text = r.recognize_google(audio_listened)
        except sr.UnknownValueError as e:
            print("Error:", str(e))
        else:
            text = f"{text.capitalize()}. "
            print(chunk_filename, ":", text)
            whole_text += text
```

```
for index, row in caseFrame.iterrows():
    date = row['date']
    year, month, day = map(int, date.split(" "))
    if(year>1970 and index%5==0):
        if(row['resultCode'] != "U" and row['dressCode'] == "V"):
            if(row['resultCode'] == "A"):
                try:
                    plt.axvline(dt.datetime(year, month, day), color="red",linewidth=0.5)
                except:
                    print("Y:",year,"M:",month,"D:",day,"failed")
            else:
                try:
                    plt.axvline(dt.datetime(year, month, day), color="white",linewidth=0.5)
                except:
                    print("Y:",year,"M:",month,"D:",day,"failed")
```

```
new_tokens = word_tokenize(sentence)
new_tokens = [t.lower() for t in new_tokens]
new_tokens = [t for t in new_tokens if t not in stopwords.words('english')]
new_tokens = [t for t in new_tokens if t.isalpha()]
lemmatizer = WordNetLemmatizer()
new_tokens = [lemmatizer.lemmatize(t) for t in new_tokens]
#counts the words, pairs and trigrams
counted = Counter(new_tokens)
counted_2= Counter(ngrams(new_tokens,2))
counted_3= Counter(ngrams(new_tokens,3))
```

Visualization: Language analysis - Courtroom rhetoric and language trends

The screenshot shows a web application interface with a dark background and red text. At the top left, it says "Unravelling the thread". At the top right, there are links for "Resources" and "About". Below the header, there are two columns: "the law" on the left and "the survivor" on the right. In the center, a white box contains the following text:

HARYANA DISTRICT COURT: STATE VS CIVIC CHANDRAN - 22 AUG, 2022
JUDGE - S KRISHNAKUMAR

"Photographs produced with the man's bail application show the **woman wearing sexually provocative dresses**, the court order said, adding that based on the court's first impression her **the complaint would not stand against the accused.**"

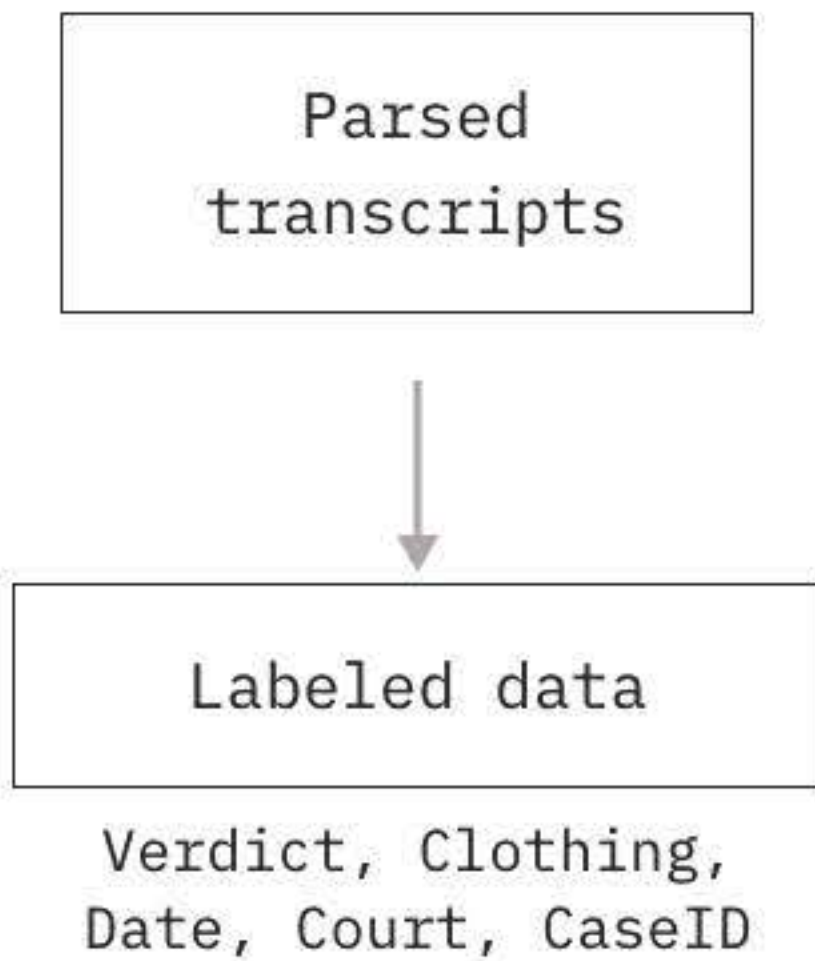

Access full text here:

nd about 5 years old. This witness had reached at P.S.I. Hospital, Jind, Distt, in pursuance of addressal DO, where, he had collected M.O of victim, Ex.PW/A, which runs into two sheets. This witness has further deposed that parents of victim had also met him there but they did not tell him anything about the incident on that night.

28. This witness has further deposed that on 01.02.2011, at about 08:00am, he had called Neetu Joshi, from Anjeja Foundation (M.O) for counseling of victim and Neetu Joshi had made counseling of the victim as well as her parents. This witness had recorded statement of Smt. Kajal, mother of victim, Ex.PW/A and made endorsement Ex.PW/A which bears his signature at point X to get registered the FIR Ex.PW/B for offence u/s 304 and 303 IPC against the present accused. 29. This witness has proved unsealed n-te plan Ex.PW/D/A which was prepared at the instance of PW 21 tender

30. This witness has proved arrest memo Ex.PW/A, personal search memo Ex.PW/B and disclosure statement Ex.PW/C of accused Al-jeev B Palla. 31. In his cross examination by Id. legal aid counsel, this witness has deposed that he had enquired the mother o-victim but she did not tell anything about the incident. This witness has further deposed that he had not recorded statement / father of victim. This witness has further deposed that he had not obtained the statements of other tenants of the building n which victim and complainant had been residing. This witness denied that he had not properly and fairly investigated the pre-sent case. STATEMENT OF ACCUSED U/S 313 Cr.P.C.: 32. After prosecution evidence, statement of accused u/s 313 Cr.P.C. was recorded

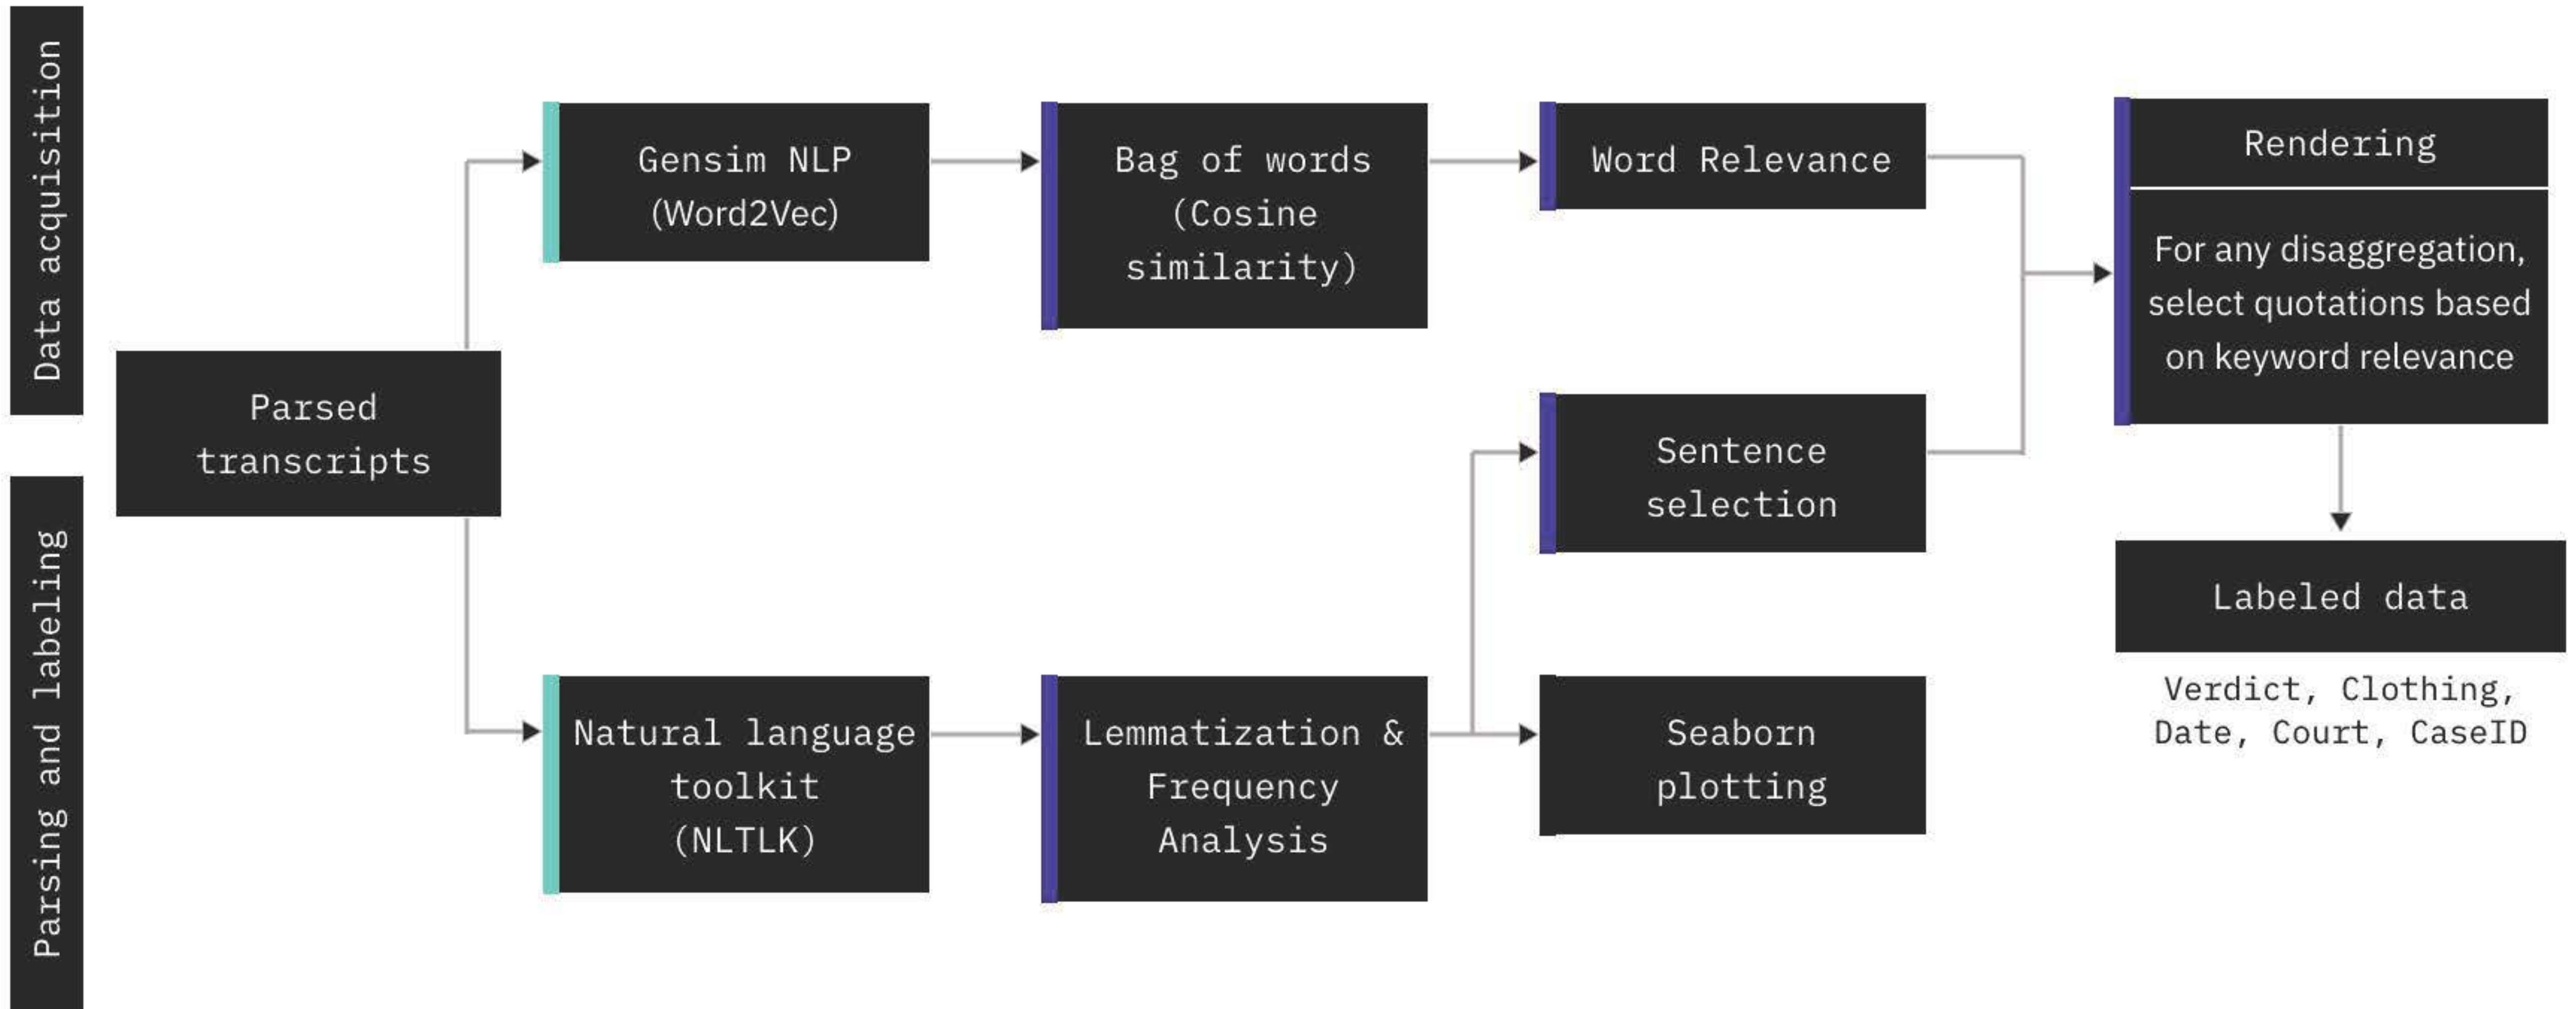

On the right side of the central text, there is a vertical label: "tion show the woman wearing 'sexually provocative' dresses".

Future Impact

Collaboration with grassroots organisations - Blank Noise

Based out of Bangalore, India, Blank Noise a public art and social rights campaign that seeks to combat sexual harassment.

We aim to work with Blank Noise and other such organisation to collect more narratives, diversify our information, concrete with survivors, and make our project more intersectional.

Scale globally to introduce threads of race, culture, and colonisation

Gender-based violence is not disjunct from race and culture. As clothing has been an important export of colonisation, we seek to understand its implications on sexual violence. In this interest, we intend to host the labeled dataset that we used for others to do further analysis with.
