Pennsylvania is a small cattle farm in Somerset, England. After one of the longest and wettest winters of the past thirty years, the relationship between Ian and his cattle is under strain. This is becoming more common due to the changing climate. During this period of severe weather, the livestock are kept inside longer than usual, physically and emotionally affecting both the farmer and animals. As the rain continues, health issues in the cattle become more common. The impact of the changing climate is first felt by those who work with the land, relying on the seasons to provide and to live.
